

Test Plan — Mech Arena

Specialisation Project (WIU) • Designer: KJH • Level 1: City Arena • Unity 6 • July 2026

This plan covers one remote, self-guided playtest of the full game loop — start menu, tutorial, battle against the AI, result screen and rematch. Feedback is collected with an 8-question Google Forms survey that testers fill in immediately after playing; each test case below is measured directly by its matching survey question.

Test Planning Summary

Each session takes about 30 minutes on the tester's own PC: around five minutes for the tutorial, fifteen for battles, and five for the survey. Ten external playtesters cover the full skill range, from players with no fast-action experience through casual action players to Gundam EXVS / Starward veterans. All test cases run on Level 1 (City Arena), designed by KJH.

Survey link: [Google Form “Mech Arena — Playtest Feedback” — keep this link live for the whole semester]

The Survey

Eight questions, about two minutes to complete:

- Q1** Experience with fast action games (none / casual / experienced / EXVS-Starward player)
- Q2** After the tutorial, how prepared did you feel for the real fight? (1-5)
- Q3** How did the mech feel to control — moving, dashing, rising? (1-5)
- Q4** How did the combat feel — melee combos + shooting? (1-5)
- Q5** Which of these did you understand and actually use? (charge shot / shield / parry punish / rainbow step / knockdown bar / none)
- Q6** Camera & readability: how well could you follow the action? (1-5)
- Q7** How difficult was the enemy? (1-5, 3 = just right)
- Q8** Most frustrating moment (bugs count!) and the one thing you would change (free text)

Test Cases & Scenarios

One test case per survey measure. A case passes or fails on the survey scores plus the free-text answers.

Test case & intention	Success criteria	Fail criteria
1. Full game loop runs remotely without help (menu → tutorial → battle → result)	Every tester reaches the survey after playing on their own machine, with no instructions beyond the start menu.	A tester cannot start, gets stuck in the loop, or needs outside help to finish a session.
2. The tutorial prepares the player for the real fight (Q2)	Most testers answer 4 or 5 on preparedness; nobody answers 1.	Several testers answer 2 or below, or quit the tutorial partway.
3. Movement and controls feel responsive — moving, dashing, rising (Q3)	Mean of 3.5 or higher; no cluster of complaints about the same input in the free text.	Mean below 3, or repeated complaints about the same control (e.g. turning, landing lock).
4. Combat feels satisfying — melee combos and shooting (Q4)	Mean of 3.5 or higher; combos described as reliable.	Mean below 3, or free-text reports of combos dropping / hits not connecting.

Test case & intention	Success criteria	Fail criteria
5. Mechanics are discovered and used: charge shot, shield, parry punish, knockdown bar, rainbow step (Q5)	Charge shot and shield ticked by nearly all testers; the knockdown bar by most; nobody ticks "None of these".	A core mechanic (charge shot / shield) under 50% adoption, or any tester ticks "None of these".
6. Camera and readability: the player can follow the action (Q6)	Mean of 3.5 or higher; at most one or two camera complaints in the free text.	Mean below 3, or the camera named repeatedly as the main problem.
7. AI difficulty is calibrated — challenging but fair (Q7)	Answers centred on 3 ("just right") across the whole skill range, with no extreme dominating.	Answers skew toward 1-2 (too easy) or 4-5 (too hard), or one skill group is consistently stomped.
8. Bugs and frustrations are captured for the report (Q8, free text)	Every tester leaves a usable answer; issues are specific enough to reproduce; no blocking bug reported.	A game-breaking bug is reported, or answers reveal confusion the earlier questions missed.
